Background

- Rivers typically have an armor layer of coarse sediment that protects the finer subsurface from erosion.
- Armor layer motion during high magnitude flows could release subsurface fine sediments that are enriched in Phosphorus (P) and Particulate Organic Carbon (POC).

Hysteresis in POC, soluble reactive phosphorus (SRP), particulate phosphorus (PP), and suspended sediment (SS) may therefore be partly controlled by armor layer motion.

Methods

- Study Site: La Jara Creek
- An armored tributary of the East Fork Jemez River in the Valles Caldera National Preserve in New Mexico.
- Channel characteristics: Slope: 8-10% - Width: 1 m
- Data were collected during high flow events in summer of 2021 and 2022
- Equipment is in two reaches:
- Upwelling

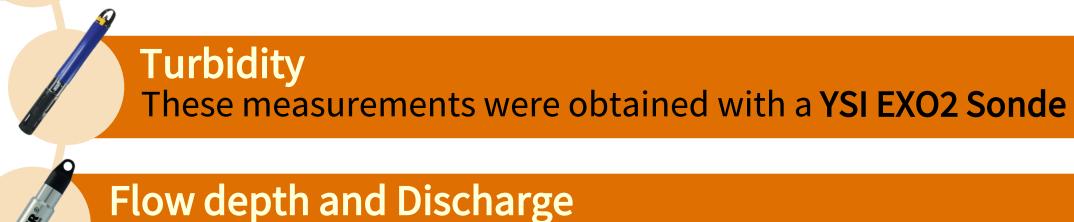

Size Class (mm)

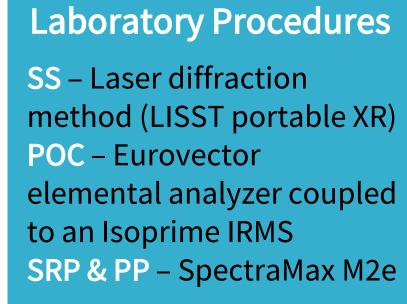

- Downwelling
- Fieldwork still ongoing during spring and summer 2023

- Measurements

Water samples (SS, SRP, POC & PP)
Collected through stage-triggered portable ISCO samplers

- Armor layer movement

RFID tracer particles and Hydrophones

128 90 Particle sizes & distances Particle sizes & timing

Tracer particle locations were recorded

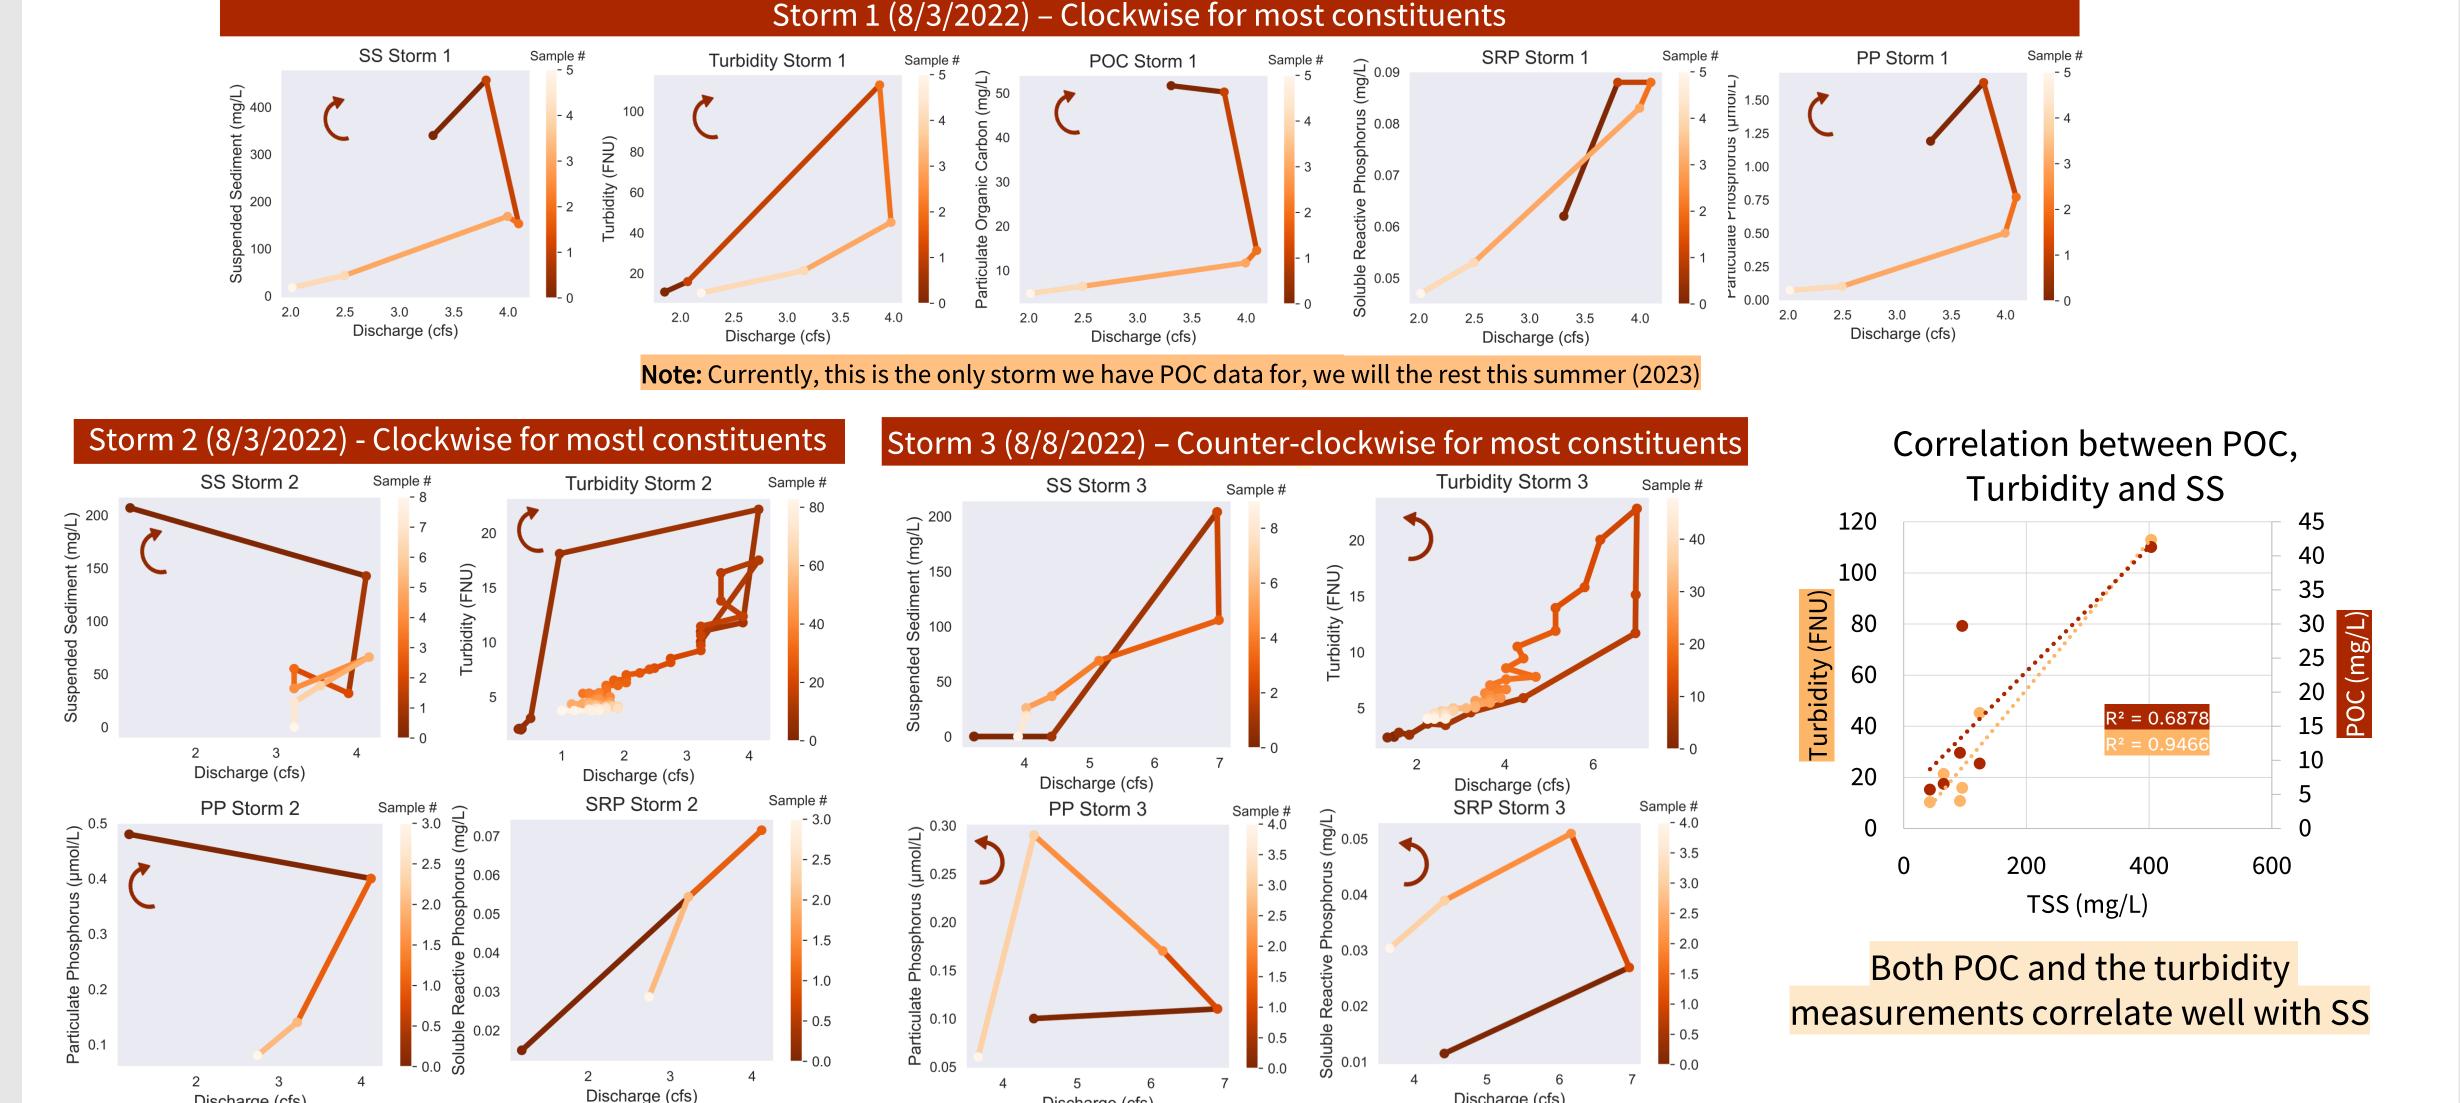

btained through **pressure transducers** installed in stilling wells

- **before** and **after** each high flow event. Transported distances were computed through the triangulation method using fixed reference points
- Hydrophone data is still being processed (no results yet)
- Field Experiments
- <u>Artificial pulse floods</u> Backed up and released water. Continuous water samples and RFID tracer movement was recorded
- Manually removed armor No flow manipulation, no hysteresis

Experiments were to isolate the effects of armor layer on nutrient and fine sediment concentrations in the water column

Results

- Only 3 storms have occurred during the study period: One storm occurred in 2021 and two occurred in 2022
- Hysteresis plots from the downwelling reach are displayed, but both reaches showed the same pattern type

The average value of all released constituents was higher in the downwelling reach. Same for peak values, except for SRP.

Note: This comparison is only available for storm 1, since all subsequent storms only have information on the downwelling reach.

Average concentrations for storm 1:							
Constituent	Upwelling	Downwelling					
SS (mg/L)	137.25	196.49					
SRP (mg/L)	0.0625	0.0702					
PP (umol/L)	9.93	12.1					
POC (mg/L)	17.31	23.22					

Peak conce	storm 1:	
Constituent	Upwelling	Downwelling
SS (mg/L)	403.52	457.12
SRP (mg/L)	0.09	0.088
PP (umol/L)	13.12	13.39
POC (mg/L)	41.28	51.66

RFID tracer particles: The river armor was displaced for each storm. The percent of bed that moved for each size class was considerably higher for storm 1 and 2 compared to storm 3, which could partly explain their differing hysteresis patterns.

Discharge (cfs)

STORM 1			STORM 2		STORM 3			
Size Class	Percent of bed that moved (%)	Average moved Distance (cm)	Size Class	Percent of bed that moved (%)	Average moved Distance (cm)	Size Class	Percent of bed that moved (%)	Average moved Distance (cm)
128	0.00	0	128	0.00	0	128	0.00	0.00
90	28.57	19.67	90	66.67	19.89	90	33.33	18.45
64	60.00	30.33	64	43.75	21.88	64	25.00	93.63
45	57.14	56.29	45	61.90	46.93	45	19.05	40.70
32	71.43	27.50	32	48.72	36.93	32	33.33	43.02

• Field Experiments: The artificial flood experiments showed consistent clockwise hysteresis for both SS and PP, but differing patterns for SRP. Further analysis is still being conducted as well as processing of POC samples.

Key Findings and current work

- Our results demonstrate how the amount of armor layer movement could impact the hysteresis patterns of released constituents.
- We are yet to determine if the timing of armor layer movement is an important factor. This will be done through the hydrophone data.
- Preliminarily, we found that downwelling reaches can potentially release higher SS and nutrient concentrations during high flow events. This is further being explored through riverbed sediment nutrient concentration comparisons in both reaches.
- We are conducting more field seasons during 2023 as well as the processing of POC samples.
